Further Work

- All galactic chemical evolution models (GCEs) depend on a set of nucleosynthetic yield tables.
- These give the elemental yields for a particular process e.g.
  - Type Ia Supernovae (Nomoto et al. 2013, Chieffi et al. 2004)
  - Core Collapse Supernovae (CC-SN) (Seitenzahl et al. 2013, Thielemann et al. 2003)
  - AGB Stars (Karakas 2010 & 2016, Ventura et al. 2013)
- Create a metric to determine how well these reproduce solar abundances

# Chempy

## Background

- Implemented GCE model is *Chempy* (Rybicki et al. 2017)
  - "A parameterized open one-zone model within a Bayesian Framework"
  - **Input:** 3 global Simple Stellar Population (SSP) parameters & 3 local ISM parameters
  - **Output:** ISM elemental abundances at time of solar birth
- Observational data is proto-solar abundances (Turcotte & Wimmer-Schweingruber 2002)
- *Chempy* calculates the best-fit parameters using MCMC sampling (Foreman-Mackey et al. 2013) to maximize the likelihood function

## Free parameters

**Table 1.** Free Chempy parameters,  $\vec{\theta}$ , and their priors with assumed Gaussian error model.

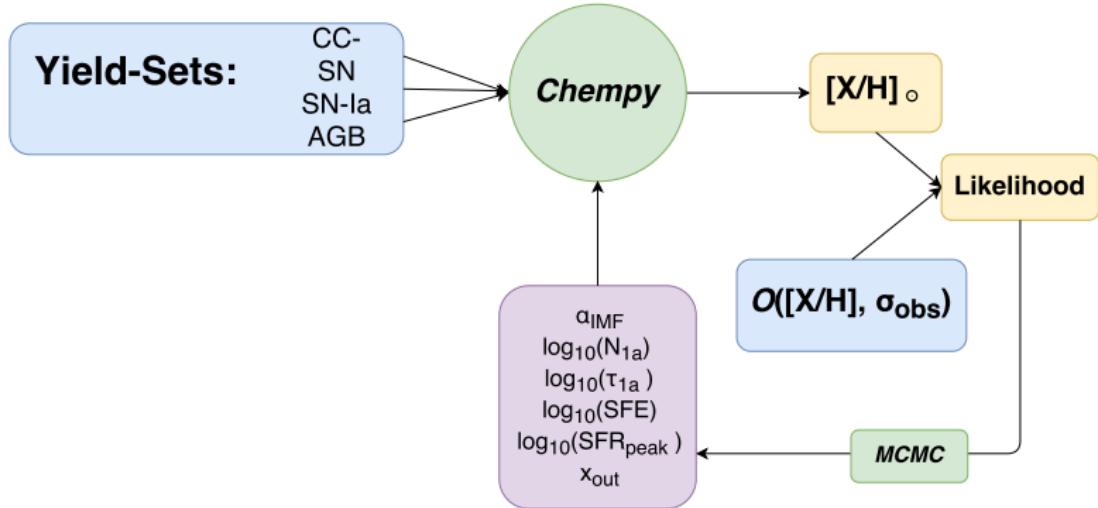

$\vec{\theta}$	description	$\bar{\theta}_{\text{prior}} \pm \sigma_{\text{prior}}$	limits	approximated prior based upon
global stellar (SSP) parameters				
$\alpha_{\text{IMF}}$	high-mass slope of the Chabrier (2003, tab.1) IMF	$-2.3 \pm 0.3$	$[-4, -1]$	Chabrier (2003, tab.1)
$\log_{10}(N_{\text{Ia}})$	number of SN Ia exploding per $M_{\odot}$ over 15 Gyr	$-2.75 \pm 0.3$	$[-5, -1]$	Maoz & Mannucci (2012, tab. 1)
$\log_{10}(\tau_{\text{Ia}})$	SN Ia delay time in Gyr until first occurrence	$-0.8 \pm 0.3$	$[-3, 1]$	Maoz et al. (2012)
local ISM parameters				
$\log_{10}(\text{SFE})$	star formation efficiency governing the infall and ISM	$-0.3 \pm 0.3$	$[-3, 2]$	?
$\log_{10}(\text{SFR}_{\text{peak}})$	peak of SFR in Gyr (scale of $\gamma$ -distribution with k=2)	$0.55 \pm 0.1$	$[-1, 1]$	van Dokkum et al. (2013, fig 4b)
$x_{\text{out}}$	fraction of stellar feedback outflowing to the corona	$0.5 \pm 0.1$	$[0, 1]$	guessed broad prior

(Philcox & Rybicki, in prep.)

# Chempy

## Calculation Schematic

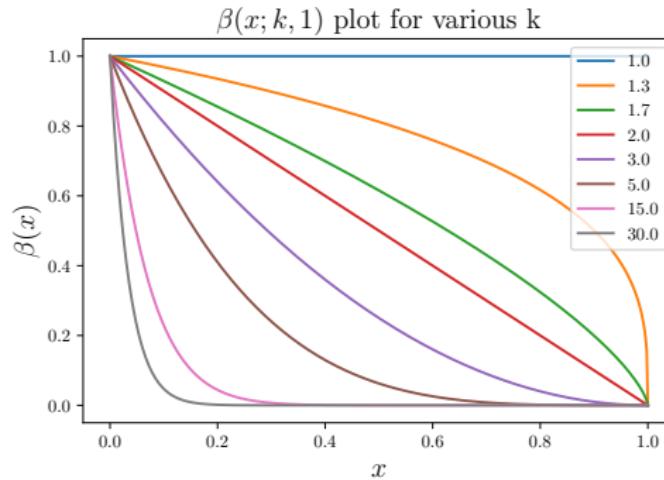

### MCMC Parameter Optimization:

# Chempy

## Error Function

- For each element, we marginalize over the model error,  $\sigma_{\text{model}}$ , to account for unmodelled effects.
- Error function is a  $\beta(x; k, 1)$  function, for abundance  $x$ .
- $k$ -parameter controls the error strength (default = 3).

# Chempy Posteriors

## Optimal parameter set

Posteriors were calculated for two choices of yield sets (hyperparameters):

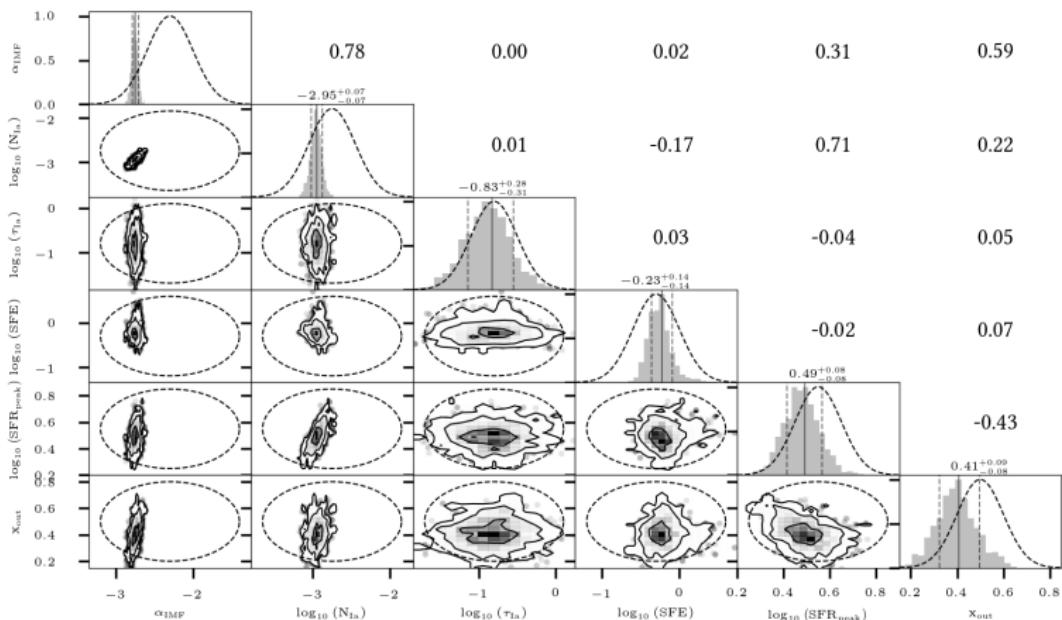

- **CC-SN:** Nomoto et al. (2013)
- **SN-Ia:** Seitenzahl et al. (2013)
- **AGB:** Karakas (2010) or Karakas (2016)

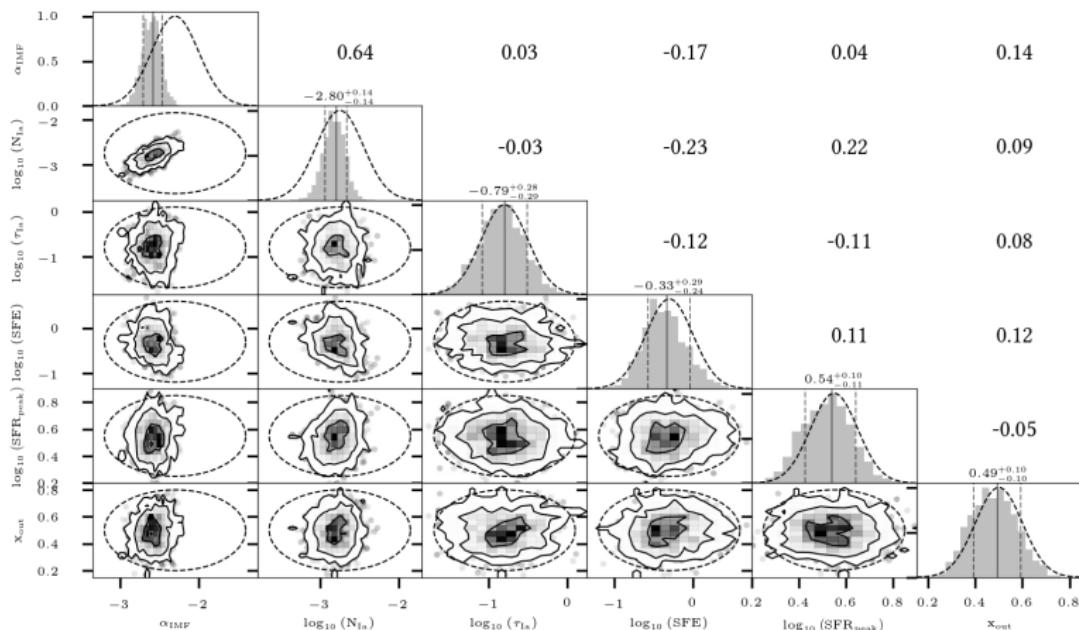

**Table 2.** Inferred parameters (16, 50, 84 percentiles of  $\theta_{\text{posterior}}$ , for different observational subsets ( $\mathcal{O}_s$ ) and different yield sets.

observational set $\mathcal{O}_s$	posterior $\mathbb{P}_{\max}$	$\alpha_{\text{IMF}}$		$\log_{10}(N_{1a})$		$\log_{10}(\tau_{1a})$		$\log_{10}(\text{SFE})$		$\log_{10}(\text{SFR}_{\text{peak}})$		$x_{\text{out}}$	
		$\mu$	$\sigma$	$\mu$	$\sigma$	$\mu$	$\sigma$	$\mu$	$\sigma$	$\mu$	$\sigma$	$\mu$	$\sigma$
(Karakas10) (With error)	1.43	-2.58	$^{+0.11}_{-0.12}$	-2.82	$\pm 0.15$	-0.86	$^{+0.31}_{-0.27}$	-0.31	$^{+0.31}_{-0.24}$	0.55	$\pm 0.10$	0.51	$\pm 0.11$
(Karakas10) (No error)	-83.41	-2.80	$\pm 0.05$	-3.06	$^{+0.07}_{-0.11}$	-0.83	$^{+0.32}_{-0.29}$	-0.26	$\pm 0.11$	0.43	$^{+0.06}_{-0.07}$	0.36	$\pm 0.09$
(Karakas16) (With error)	1.60	-2.58	$\pm 0.12$	-2.80	$\pm 0.14$	-0.79	$^{+0.28}_{-0.29}$	-0.33	$^{+0.29}_{-0.24}$	0.54	$^{+0.10}_{-0.11}$	0.49	$\pm 0.10$
(Karakas16) (No error)	-84.01	-2.75	$\pm 0.04$	-2.95	$\pm 0.07$	-0.83	$^{+0.28}_{-0.31}$	-0.23	$\pm 0.14$	0.49	$\pm 0.08$	0.41	$^{+0.09}_{-0.08}$

(Philcox & Rybicki, in prep.)

## Output for Karakas (2016) AGB yields

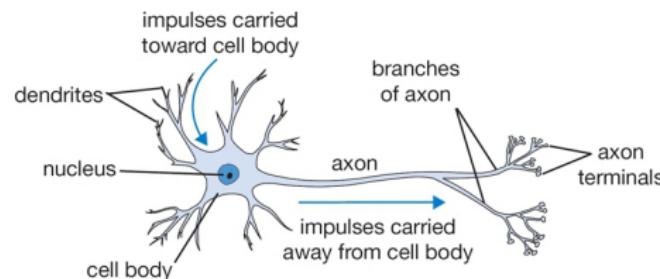

Output for Karakas (2016) AGB yields with  $\beta$  error model

# Neural Networks

## Motivation

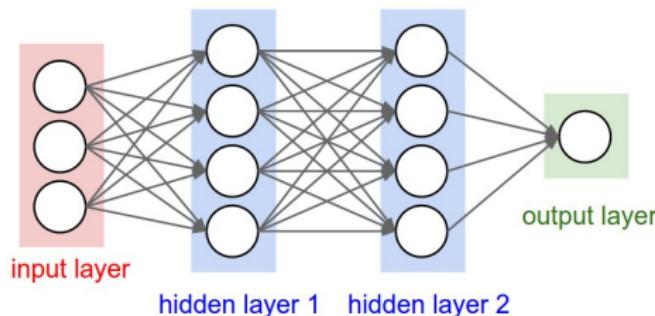

- The *Chempy* code takes  $\approx 3\text{s}$  to run per set of parameters queried
  - This is too slow for efficient MCMC sampling and future parameter-space integration:
    - Train a neural network to predict the output abundances from input parameters
    - This runs in 7 ms here

# Neural Networks

## Network Structure

Network schematic:

Karparthy et al. (2017)

Our implementation:

- 6 inputs (parameter vector  $\theta$ )
- 22 outputs ([X/Fe] abundances)
- 1 hidden layer with 30 neurons

# Neural Networks

## Network Structure

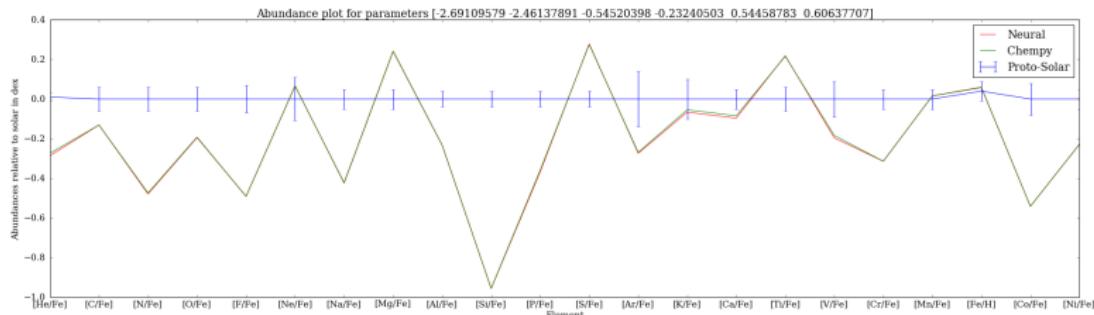

- Network created using *PyTorch* ([pytorch.org](https://pytorch.org))
- Settings used:
  - Adam sampler (Kingma & Ba 2014)
  - L1 loss function
  - tanh activator function
  - PyTorch's ReduceLROnPlateau function
  - 5000 training epochs

# Neural Networks

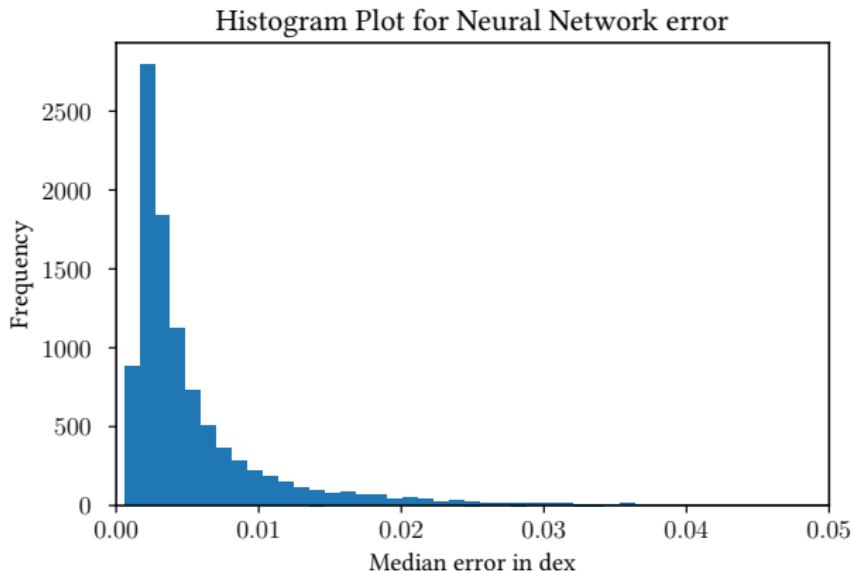

## Training the Network

- ① Create network architecture
- ② Load  $5^6$  element training data-set, with parameters evenly distributed in Gaussian prior space
- ③ Train neural network with data-set
- ④ Optimize learning rate using random 10,000 element verification data-set (0.003 here)
- ⑤ Test settings with a further random 10,000 element data-set

## Median Element Error Corner Plot

# How can we create an objective scoring for yield tables?

- Use Bayes' factor to compare yield sets

$$K = \frac{K_1}{K_2};$$

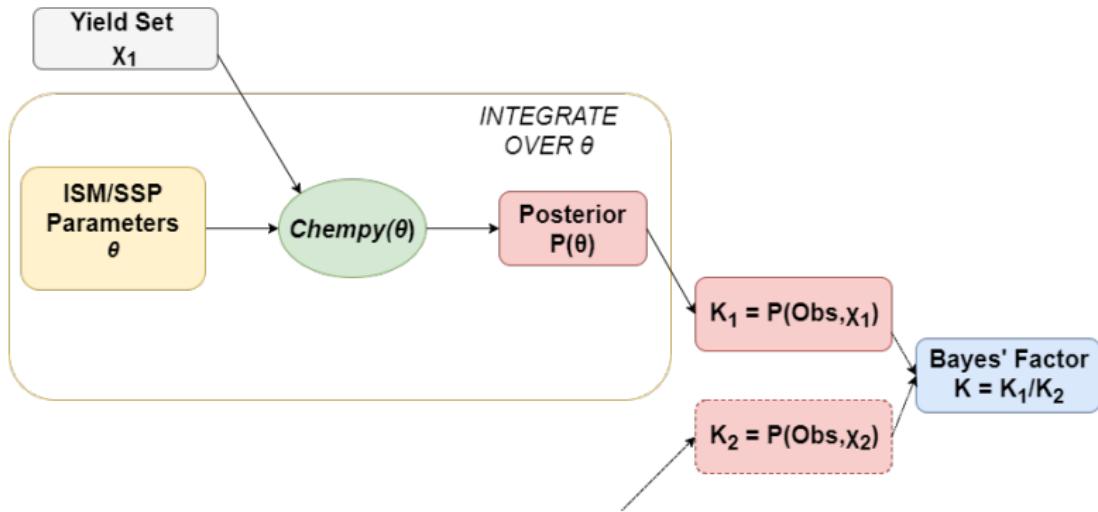

$$K_k = P(\mathcal{O}|\chi_k) = \int_{\vec{\theta}} P(\mathcal{O}|\vec{\theta}, \chi_k) p(\vec{\theta}) d\vec{\theta}$$

for observations  $\mathcal{O}$  and yield sets  $\chi$ , with prior  $p(\vec{\theta})$  on the parameters.

- This is just the integrated posterior in 6 dimensions.
- If  $K \gg 1$  then  $\chi_1$  better represents solar abundances than  $\chi_2$ .
- Using the neural networks, we can calculate this integral using Monte Carlo methods e.g. `mcint` (Snowsill, 2011)

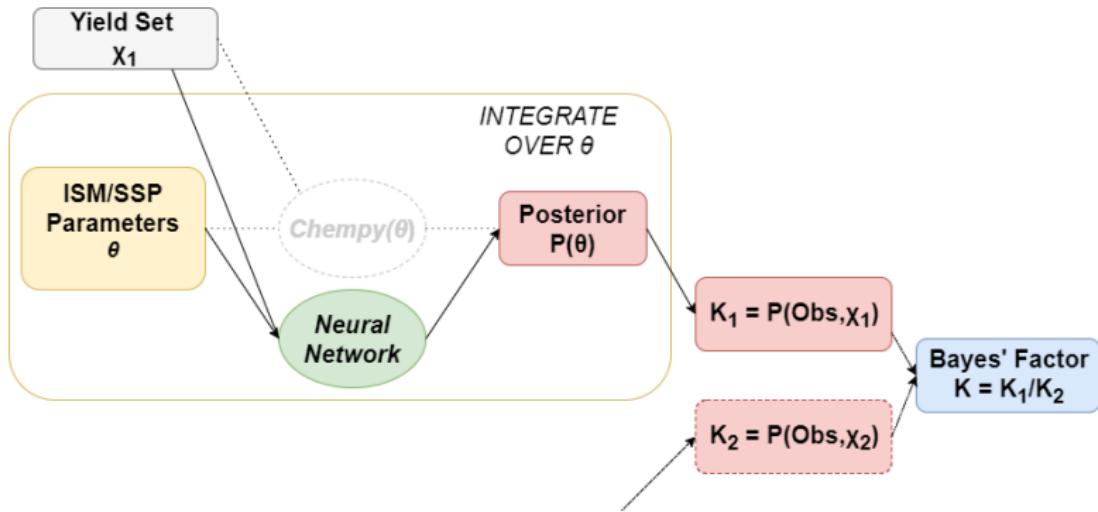

# Objective Scoring Outline

## With Chempy

# Objective Scoring Outline

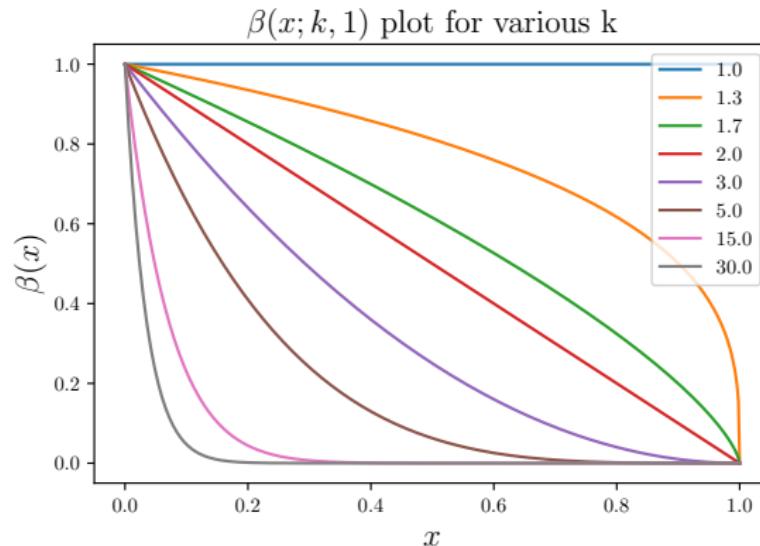

## With Neural Network

# Objective Scoring

## Elements & Errors

- Which elements should we fit for?
  - Probably all elements else we introduce additional bias.
- The model error in each element of *Chempy* is not known.
- Currently we marginalize over the error during each posterior calculation, using a  $\beta$  model.

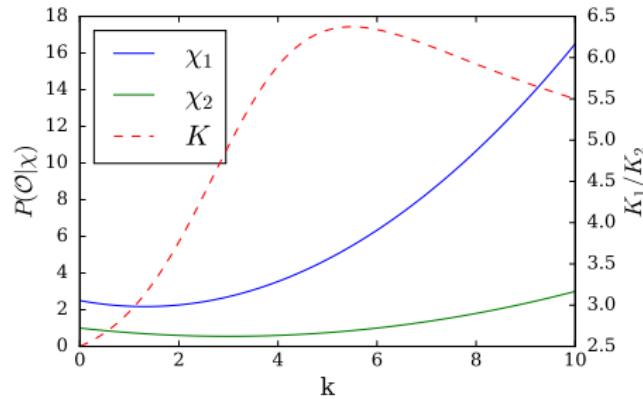

# Objective Scoring

## Elements & Errors

- One option:

- Parameterize the error using the  $\beta(x, k, 1)$   $k$ -parameter
- Calculate  $K(k)$  across  $k$ -space
- As  $k \rightarrow \infty$ , the error tends to 0
- As  $k \rightarrow 1$  the error tends to 1 dex

- Any other suggestions?

# Further Work

- Implement objective scoring function into *Chempy*
  - Widen the training data-set to span  $3\sigma$  per parameter
  - Retest neural network
  - Integrate over parameter space using Monte Carlo methods
  - Calculate objective score
- Test approach on different sets of yield tables
